

# MICRO-MATCH

micro-nutrients

### What is MICRO-MATCH?

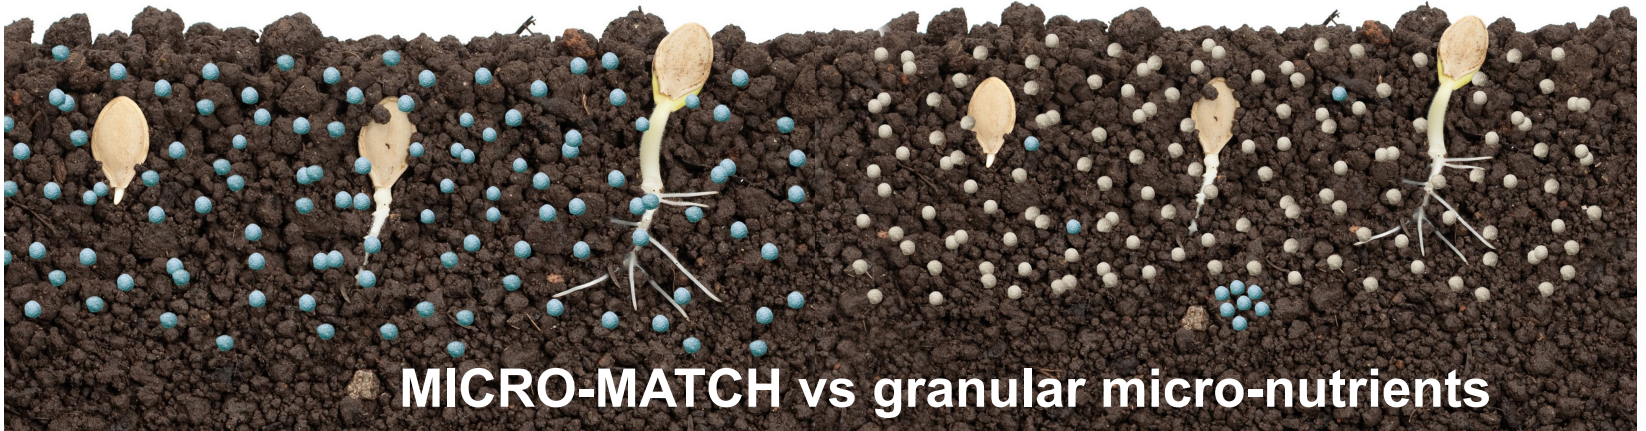

MICRO-MATCH is a range of secondary and micro-nutrients which can be incorporated on to any Origin product (except Ammonium Nitrate). All are finely milled and use an electro-static charge to adhere to the granules.

### Why use MICRO-MATCH?

- ✓ Even coating across 100% of fertiliser granules = even distribution in the soil
- ✓ Contains dual-action forms of nutrient for early uptake and extended availability
- ✓ Can be added to a full range of prescription fertilisers

### Why is MICRO-MATCH different to other micro-nutrients?

Every fertiliser granule is evenly coated with micro-nutrients, giving typically 50 times more interception points than granular micro-nutrients. Applying MICRO-MATCH with a starter fertiliser can bridge the vital 4-6 week 'hunger gap' between emergence and foliar applications of micro-nutrients.

**MICRO-MATCH vs granular micro-nutrients**

## MICRO-MATCH

micro-nutrients on every granule ensures uniform distribution of nutrient across a field and maximum interception points with roots for early plant uptake.

Micro-nutrients are required in small amounts, and when applied in a granular form very few granules may be in the blend - illustrated in blue above - and can be difficult for the roots to access or can create cluster 'hotspots'.

**MICRO-MATCH**  
Boron 18.5% B

**MICRO-MATCH**  
Calcium 38% CaO

**MICRO-MATCH**  
Cobalt 5% Co

**MICRO-MATCH**  
Copper 57% Cu

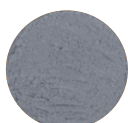

**MICRO-MATCH**  
Iron 47% Fe

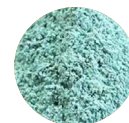

**MICRO-MATCH**  
Magnesium 50% MgO

**MICRO-MATCH**  
Manganese 33% Mn

**MICRO-MATCH**  
Molybdenum 20% Mo

**MICRO-MATCH**  
Selenium 1% Se

**MICRO-MATCH**  
Zinc 62% Zn
